EDUCATION

University of Guelph — Guelph, Ontario, Canada
Bachelor of Computing, Honours Computer Science — Specialization in A.I. — *September 2024 – April 2028*

EXPERIENCE

Cybrid — Toronto, Ontario, Canada
Engineering Intern — B2B Team — *May 2026 – September 2026*

- Enabled 5 new payout corridors across 4 payment rails (Hong Kong, the Netherlands, Germany, Pakistan, and Bangladesh) and generalized the SEPA integration so onboarding the next Eurozone country is a one-line change.
- Diagnosed and resolved a crypto-to-fiat conversion regression and shipped account and wallet creation functionality on the Accounts page.
- Built the Playwright end-to-end test suite for the portal-payments product from the ground up — 10 hermetic test cases covering recipients, payments, conversions, transaction details, and insufficient-balance guards — making it the last of the company's portals to gain E2E coverage in CI.
- Integrated the suite into CircleCI and the Makefile and built a non-interactive authentication flow that preserves authenticated CI sessions without manual OAuth login; every subsequent merge to the codebase now runs through these tests.
- Authored the onboarding documentation for new engineers, consolidating setup information that had previously been scattered across the codebase and internal tools.

Interac Corp. — Toronto, Ontario, Canada
e-Transfer AppOps Intern — *May 2025 – September 2025*

- Investigated and drove resolution of production incidents in live e-Transfer environments, using Splunk for log analysis, system health monitoring, and root-cause investigation.
- Maintained ServiceNow runbooks and incident-response documentation and prioritized incoming tickets alongside development and infrastructure teams, reducing resolution time for recurring issues.

Eden's Box — Ontario, Canada
Co-Founder & Product Lead — *March 2023 – September 2025*

- Co-founded an impact-driven startup centered on sustainable living, wellness, and environmental education, growing the initiative from concept to a funded, school board-recognized venture.
- Secured $4,000 in seed funding through competitive pitching to business owners, investors, and community stakeholders, validating the product's market potential.

PROJECTS

Treasure Run | *C, Python, ctypes, curses* — github.com/talinehenin/Treasure-Runner

- Sokoban-style terminal dungeon game where the player pushes obstacles and collects treasure across interconnected rooms linked by portals, with run progress and profile stats persisted to JSON between sessions.
- Built as a two-language system: room, player, and pushable-object state live in a C core exposed to a Python runtime through ctypes bindings, requiring an explicit boundary for struct layout and memory ownership.
- Structured the Python side as MVC — a model wrapping the C engine, a controller owning game flow, and a curses view handling all rendering — so engine and game logic could be exercised by an assertion-based test suite without starting the UI.

TECHNICAL SKILLS

Languages: C, C++, Python, JavaScript, TypeScript
Web & Backend: Next.js, React, Tailwind CSS, HTML/CSS
Tools & Platforms: Git, GitHub, Vercel, Docker
Testing & CI: Playwright, End-to-End Test Design, CI/CD Integration (CircleCI), Regression Testing, Test Plan Authoring
Monitoring & Operations: Splunk (log analysis), ServiceNow (incident management), Jira, Confluence
